

#### City of Dallas Comments - EPA webpage/information sharing

- Surface water pathway results compared to human health benchmarks (TCEQ) - below contact recreation (incidental ingestion and dermal contact) and fishery (incidental or sustainable, dependent on stream size) from samples collected near baseball diamond
  - May need to check with DSHS on these numbers - Rebecca can help coordinate
  - Stress streams sampled near site are separate from Fivemile Creek that runs through College Park
  - Indicate that Trinity River near Joppa Preserve has pre-existing fish advisories that are not related to the site (PCBs, Dioxins)
- Emphasizing neighborhoods around site are on City of Dallas water supply, which is sourced from surface water. The fact that the source is surface water upstream from the site and not groundwater additionally emphasizes that their drinking water source is not affected from site groundwater contamination

#### Other Comments

- Provide TCEQ PM contact information on EPA webpage for site
- Add statement that if people want more details on site investigative history to contact TCEQ
- Emphasize immediate hazards/imminent threats have been removed in "What Has Been Done to Clean Up the Site" section
- Discuss EPA's next step to investigate extent of contamination under "Current Site Status"
- Link to be added to mailing list (or who to email to be added) in "Stay Updated, Get Involved" section
- Update "Contaminant List" and provide fact sheets on main chemicals in same area
